

IN THE U.S. PATENT AND TRADEMARK OFFICE

APPLICANT:

Yamaguchi University and
NISSAN CHEMICAL INDUSTRIES, LTD.

FOR:

ELECTRODE FOR ENERGY STORAGE DEVICE AND
PROCESS FOR PRODUCING THE SAME

D E C L A R A T I O N

Honorable Commissioner of Patents
Washington, D.C. 20231

Sir,

I, Takashi Kojima, a patent attorney of Ginza
Ohtsuka Bldg., 2F, 16-12, Ginza 2-chome, Chuo-ku, Tokyo,
Japan do hereby solemnly and sincerely declare:

1) THAT I am well acquainted with Japanese language
and English language;

2) THAT the attached is a full, true and faithful
translation into English made by me of the PCT application
of which number is PCT/JP2005/001388, filed in Japan
on the 1 February 2005.

3) THAT I declare further that all statements made herein of my own knowledge are true and all statements made on information and belief are believed to be true, and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment or both, under Section 1001 of Title 18 of the United States Code and that such willful statements may jeopardize the validity of the application or any patent issued thereon.

AND I being sworn state that the facts set forth above are true.

Dated this 18th day of July 2006

Takashi KOJIMA

DESCRIPTIONELECTRODE FOR ENERGY STORAGE DEVICE AND
PROCESS FOR PRODUCING THE SAME

5

TECHNICAL FIELD

[0001]

This invention relates to an electrode for energy
storage device and also to a method for making the same.
More particularly, the invention relates to an electrode for
energy storage devices containing an aminoquinoxaline polymer
as an active material for the electrode and the manufacture
thereof.

15

BACKGROUND ART

[0002]

An electric double layer capacitor that is known as
one of energy storage devices is generally constituted of a
pair of polarizable electrodes each containing a porous
material, a separator, an electrolyte solution and the like.
This electric double layer capacitor is a device which makes
use, as a charge and discharge mechanism, of an electric
energy ascribed to the electric double layer established
through ionic movement at the interface between the
electrodes. Because no electrochemical reaction of an
electrode active material is involved, the capacitor does not
have such a life as of secondary cells, along with
characteristic features including excellent instantaneous
charge and discharge characteristics, stable charge and
discharge characteristics kept over a wide temperature range,
and a reduced lowering of performance in repeated use.

30

[0003]

It has been hitherto accepted that the electrostatic
capacitance of an electric double layer capacitor has a
proportional relation with surface areas of polarizable
electrodes. Accordingly, porous materials having a large

35

specific surface area have been studied for use as a polarizable electrode in order to increase the capacitance.

More particularly, the polarizable electrode has been usually made by mixing a porous material such as a carbonaceous material or the like, acetylene black used as a conductive auxiliary agent, and a fluorine polymer or rubbery polymer to obtain an electrode composition, and applying the electrode composition onto a current collector. For instance, attempts have been made to enhance the electrostatic capacitance by using, as a carbonaceous material, active carbon (or a porous carbonaceous material) that exhibits high electric conductivity, is relatively stable in electrochemical aspect and has a large specific surface area.

More particularly, a carbonaceous material, such as coal, coal coke, coconut shell, wood flour, resins and the like, is subjected activation (porous treatment) with an oxidative gas such as steam, air, oxygen, CO₂, or the like or by means of a chemical such as zinc chloride, potassium hydroxide or the like, thereby forming fine pores therein. The resulting active carbon with a large surface area has been used.

[0004]

In recent years, as developments in electronics devices, electric cars and the like are being in progress, the fundamental design of energy storage devices including an electric double layer capacitor is also being changed.

For instance, an electric double layer capacitor needs to have an energy highly densified and be small in size and light in weight. Hence, it becomes necessary to design the capacitor so that not only an electrostatic capacitance per unit weight (F/g) of porous material, but also an electrostatic capacitance per unit volume (F/cm³) is improved (see Patent Document 2: JP-A 2000-68164; Patent Document 3: JP-A 2000-100668; and Patent Document 5: JP-A 11-214270).

[0005]

The electrostatic capacitance per unit weight of a porous material (polarizable electrode) can be increased by

using such a porous material with a large surface area as set out hereinabove.

However, as the specific surface area increases, the density (fill rate) of a porous material lowers. In this sense, the electrostatic capacitance per unit volume is not always in proportional relation with an increase in specific surface area. In fact, it is known that when the specific surface area increases to or over a certain extent, the electrostatic capacitance per unit volume tends to lower.

Thus, when using only the procedure of trying to increase the specific surface area of a porous material, limitation is placed on the increase of the electrostatic capacitance of an electric double layer capacitor, thus making it difficult to attain the high densification of an energy to a level required in recent years (see Patent Document 1: JP-A 11-317333 and Patent Document 4: JP-A 11-297577).

[0006]

On the other hand, developments have been made on energy storage devices such as polymer cells or capacitors using conductive polymers as an electrode active material.

Where positive and negative electrodes are, respectively, made of a conductive polymer of a similar type, it is limited to broaden a reaction potential depending on the oxidation-reduction potential of the positive and negative electrodes. Thus, it is generally difficult to make a polymer cell or capacitor which works at high voltage.

Polythiophene is a substance whose HOMO (highest occupied molecular orbital) and LUMO (lowest occupied molecular orbital) are, respectively, observed at oxidation side and reduction side positions of about 0.7 V and about 2.3 V when measuring by use of a silver/silver oxide electrode as a reference electrode. From this, it can be expected that this compound exhibits wide potential activity under conditions where a conductive polymer of a similar type is used for the positive and negative electrodes, respectively. Thus, studies have been made on an electrode

using polythiophene to provide a wide voltage range (see Non-Patent Document 1: Journal Power Source).

[0007]

Further, a polymer cell or capacitor has been already
5 developed wherein different types of conductive polymers are
used as positive and negative electrodes, respectively, in
such a way that a conductive polymer more susceptible to
oxidation is used as a positive electrode and a conductive
polymer more susceptible to reduction is used as a negative
10 electrode. The cell or capacitor is usable over a wide
voltage range with the capacitance being high (see Patent
Document 6: JP-A 2002-134162). In this cell or capacitor,
poly-5-cyanoindole is used as a positive electrode active
material, and polyphenylquinoxaline is used as a negative
15 electrode active material.

However, since this energy storage device needs to use
different types of molecules in the positive and negative
electrodes as set out hereinabove, this is defective from the
standpoint of productivity. Thus, there is a demand for
20 development of a conductive polymer compound that can be used
as both positive and negative electrodes and can serve as an
electrode active material showing wide potential activity.

DISCLOSURE OF INVENTION

PROBLEMS TO BE SOLVED BY THE INVENTION

35 [0009]

Under these circumstances, the invention has been
accomplished and has for its object the provision of an

electrode for energy storage devices and a method for making same wherein an electric energy can be densified at a required level and thus, the device can be made small in size and lightweight.

5

MEANS FOR SOLVING THE PROBLEMS

[0010]

In order to achieve the above object, we made intensive studies and, as a result, found that an electrode containing, as an electrode active material, a conductive polymer obtained by polymerizing a novel aminoquinoxaline compound enables the use, as an energy source, of the oxidation-reduction reaction of the polymer compound and the electric double layer occurring on the surface of the polymer compound. Thus, the device using such electrodes is able to store charges at a higher capacitance than a device using electrodes made mainly of known active carbon. The invention has been accomplished based on the above finding.

[0011]

20 More particularly, the invention contemplates to provide the following electrodes for an energy storage device, energy storage devices including the electrodes, and methods for making the electrodes.

[1] An electrode for an energy storage device including a polyaminoquinoxaline compound of the following formula (1a) as an electrode active material

[Chemical Formula 1]

wherein R^1 and R^2 independently represent a hydrogen atom, a hydroxyl group, a C_1 - C_{10} alkyl group, a C_1 - C_{10} alkoxy group, a phenyl group which may be substituted with Y, a pyridyl group which may be substituted with Y, a biphenyl group which may be substituted with Y, a naphthyl group which may be substituted with Y, a thienyl group which may be substituted with Y, a pyrrolyl group which may be substituted with Y, a furyl group which may be substituted with Y or a condensed heteroaryl group which may be substituted with Y provided that when R^1 and R^2 are, respectively, the above-defined phenyl, pyridyl, biphenyl, naphthyl, thienyl, pyrrolyl, furyl or condensed heteroaryl group, these groups may be joined through a single bond; R^3 and R^4 independently represent a hydrogen atom, a halogen atom, a cyano group, a nitro group, an amino group, a C_1 - C_{10} alkyl group, a C_1 - C_{10} alkoxy group, a phenyl group which may be substituted with Y, a pyridyl group which may be substituted with Y, a biphenyl group which may be substituted with Y, a naphthyl group which may be substituted with Y, a thienyl group which may be substituted with Y, a pyrrolyl group which may be substituted with Y, a furyl group which may be substituted with Y or a condensed heteroaryl group which may be substituted with Y provided that when R^3 and R^4 are, respectively, the above-defined phenyl, pyridyl, biphenyl, naphthyl, thienyl, pyrrolyl, furyl or condensed heteroaryl group, these groups may be joined through a single bond; X^1 represents $-NH-R^5-NH-$ or $-NH-R^6-$ wherein R^5 and R^6 independently represent a C_1 - C_{10} alkylene group, a $-C(O)CH_2-$, $-CH_2C(O)-$, a divalent benzene ring which may be substituted with Y, a divalent pyridine ring which may be substituted with Y, a divalent biphenyl group which may be substituted with Y, a divalent naphthalene ring which may be substituted with Y, a divalent thiophene ring which may be substituted with Y, a divalent pyrrole ring which may be substituted with Y, a furan ring which may be substituted with Y, or a condensed hetero ring which may be substituted with Y, in which Y represents a halogen atom, a cyano group, a nitro group, an amino group, an epoxy group, a vinyl group,

a C₁-C₁₀ alkyl group, a C₁-C₁₀ haloalkyl group, a C₁-C₁₀ alkoxy group, a C₁-C₁₀ cyanoalkyl group, a phenyl group which may be substituted with Z, a pyridyl group which may be substituted with Z, a biphenyl group which may be substituted with Z, a naphthyl group which may be substituted with Z, a thienyl group which may be substituted with Z, a pyrrolyl group which may be substituted with Z, a furyl group which may be substituted with Z or a condensed heteroaryl group which may be substituted with Z provided that if Y is two or more in number, Y may be the same or different, in which Z represents a halogen atom, a cyano group, a nitro group, an amino group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a C₁-C₁₀ haloalkyl group, a C₁-C₁₀ alkoxy group, a C₁-C₁₀ cyanoalkyl group, a phenyl group, a biphenyl group, a naphthyl group, a thienyl group, a pyrrolyl group, a furyl group or a condensed heteroaryl group provided that if Z is two or more in number, Z may be the same or different; and n is an integer of 2 or over.

[2] The electrode as recited in 1 above, wherein R¹ and R² independently represent a group of the following formula (2)

[Chemical Formula 2]

wherein R⁷-R¹¹ independently represent a hydrogen atom, a halogen atom, a cyano group, a nitro group, an amino group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a C₁-C₄ haloalkyl group, a C₁-C₁₀ alkoxy group, a C₁-C₄ cyanoalkyl group, a phenyl group which may be substituted with Z, a naphthyl group which may be substituted with Z or a thienyl group which may be substituted with Z in which Z has the same meaning as defined above.

[3] The electrode as recited in 1 above, wherein R¹ and R² independently represent a group of the following formula (3)
[Chemical Formula 3]

5 wherein R¹²-R¹⁸ independently represent, each substituted at an arbitrary position of the ring of the formula, a hydrogen atom, a halogen atom, a cyano group, a nitro group, an amino group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a C₁-C₁₀ alkoxy group, a phenyl group which may be substituted
10 with Z, a naphthyl group which may be substituted with Z or a thienyl group which may be substituted with Z in which Z has the same meaning as defined above.

[4] The electrode as recited above, wherein R¹ and R² independently represent a group of the following formula (4)
15 [Chemical Formula 4]

wherein R¹⁹-R²¹ independently represent, each substituted at an arbitrary position of the ring of the formula, a hydrogen atom, a halogen atom, a cyano group, a nitro group, an amino group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a C₁-C₁₀ alkoxy group, a phenyl group which may be substituted
20 with Z, a naphthyl group which may be substituted with Z or a thienyl group which may be substituted with Z in which Z has the same meaning as defined above; and A¹ represents NH, O or
25 S.

[5] The electrode as recited in 1 above, wherein R¹ and R² independently represent a group of the following formula (5)

[Chemical Formula 5]

5 wherein R²² represents a halogen atom or a cyano group, and R²³-R²⁶ independently represent a hydrogen atom, a halogen atom, a cyano group, a nitro group, an amino group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a C₁-C₁₀ alkoxy group, a phenyl group which may be substituted with Z, a
 10 naphthyl group which may be substituted with Z or a thienyl group which may be substituted with Z, in which Z has the same meaning as defined above.

[6] The electrode as recited in any one of 1 to 5 above, wherein R⁵ represents a group of the following formula (6)

15 [Chemical Formula 6]

wherein R²⁷-R³⁰ independently represent, each substituted at an arbitrary position on the ring of the formula, a hydrogen atom, a halogen atom, a cyano group, a nitro group, an amino group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a
 20 C₁-C₁₀ alkoxy group, a phenyl group which may be substituted with Z, a naphthyl group which may be substituted with Z or a thienyl group which may be substituted with Z, in which Z has the same meaning as defined above.

[7] The electrode as recited in any one of 1 to 5 above,
wherein R⁵ represents a group of the following formula (7)

[Chemical Formula 7]

5 wherein R³¹-R³² independently represent, each substituted at
an arbitrary position on the ring of the formula, a hydrogen
atom, a halogen atom, a cyano group, a nitro group, an amino
group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a
C₁-C₁₀ alkoxy group, a phenyl group which may be substituted
10 with Z, a naphthyl group which may be substituted with Z or a
thienyl group which may be substituted with Z, in which Z has
the same meaning as defined above; and W¹ represents NH, O or
S.

[8] The electrode as recited in any one of 1 to 5 above,
15 wherein R⁵ represents a group of the following formula (8)
[Chemical Formula 8]

wherein R³³-R³⁴ independently represent, each substituted at
an arbitrary position on the ring of the formula, a hydrogen
20 atom, a halogen atom, a cyano group, a nitro group, an amino
group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a
C₁-C₁₀ alkoxy group, a phenyl group which may be substituted
with Z, a naphthyl group which may be substituted with Z or a
thienyl group which may be substituted with Z, in which Z has
25 the same meaning as defined above; and Q¹ represents NH, O or
S.

[9] The electrode as recited in any one of 1 to 5, wherein R⁵ represents a group of the following formula (9)

[Chemical Formula 9]

5 wherein R³⁵-R⁴⁰ independently represent, each substituted at an arbitrary position on the ring of the formula, a hydrogen atom, a halogen atom, a cyano group, a nitro group, an amino group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a C₁-C₁₀ alkoxy group, a phenyl group which may be substituted
10 with Z, a naphthyl group which may be substituted with Z or a thienyl group which may be substituted with Z, in which Z has the same meaning as defined above.

[10] The electrode as recited in any one of 1 to 5 above, wherein R⁶ represents a group of the following formula (10)

15 [Chemical Formula 10]

wherein R⁴¹-R⁴⁴ independently represent, each substituted on an arbitrary position of the ring of the formula, a hydrogen atom, a halogen atom, a cyano group, a nitro group, an amino
20 group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a C₁-C₁₀ alkoxy group, a phenyl group which may be substituted with Z, a naphthyl group which may be substituted with Z or a thienyl group which may be substituted with Z, in which Z has the same meaning as defined above.

[11] The electrode as recited in any one of 1 to 5 above,
wherein R⁶ represents a group of the following formula (11)

[Chemical Formula 11]

5 wherein R⁴⁵-R⁴⁶ independently represent, each substituted on
an arbitrary position of the ring of the formula, a hydrogen
atom, a halogen atom, a cyano group, a nitro group, an amino
group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a
C₁-C₁₀ alkoxy group, a phenyl group which may be substituted
10 with Z, a naphthyl group which may be substituted with Z or a
thienyl group which may be substituted with Z, in which Z has
the same meaning as defined above; and W² represents NH, O or
S.

[12] The electrode as recited in any one of 1 to 5 above,
15 wherein R⁶ represents a group of the following formula (12)
[Chemical Formula 12]

wherein R⁴⁷-R⁴⁸ independently represent, each substituted on
an arbitrary position of the ring of the formula, a hydrogen
20 atom, a halogen atom, a cyano group, a nitro group, an amino
group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a
C₁-C₁₀ alkoxy group, a phenyl group which may be substituted
with Z, a naphthyl group which may be substituted with Z or a
thienyl group which may be substituted with Z, in which Z has
25 the same meaning as defined above; and Q² represents NH, O or
S.

[13] The electrode as recited in any one of 1 to 5 above, wherein R⁶ represents a group of the following formula (13)

[Chemical Formula 13]

5 wherein R⁴⁹-R⁵⁴ independently represent, each substituted on an arbitrary position of the ring of the formula, a hydrogen atom, a halogen atom, a cyano group, a nitro group, an amino group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a C₁-C₁₀ alkoxy group, a phenyl group which may be substituted
 10 with Z, a naphthyl group which may be substituted with Z or a thienyl group which may be substituted with Z, in which Z has the same meaning as defined above.

[14] The electrode as recited in 1 above, wherein the group formed by bonding R¹ and R² through a single bond is

15 represented by the formula (14)

[Chemical Formula 14]

wherein A²'s are each C or N, R⁵⁵-R⁶² independently represent a hydrogen atom, a halogen atom, a cyano group, a nitro group,
 20 an amino group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a C₁-C₁₀ alkoxy group, a phenyl group which may be substituted with Z, a naphthyl group which may be substituted with Z or a thienyl group which may be substituted with Z, in which Z has the same meaning as defined above, provided that
 25 when A² represents N, R⁵⁸ and R⁵⁹ are both non-existent.

[15] An electrode for an energy storage device comprising a polyaminoquinoxaline compound of the following formula (1b) as an electrode active material

[Chemical Formula 15]

5

wherein R^{1'} and R^{2'} join together to form -CH₂CH₂CH₂-, -CH₂CH₂O-,
 -OCH₂CH₂-, -CH₂OCH₂-, -OCH₂O-, -CH₂CH₂S-, -SCH₂CH₂-, -CH₂SCH₂-,
 -CH₂CH₂N(R')-, -N(R')CH₂CH₂-, -CH₂N(R')CH₂-, -CH₂CH₂CH₂CH₂-,
 -CH₂CH₂CH₂O-, -OCH₂CH₂CH₂-, -CH₂CH₂OCH₂-, -CH₂OCH₂CH₂-, -CH₂OCH₂O-,
 10 -OCH₂CH₂O-, -SCH₂CH₂S-, -OCH₂CH₂S-, -SCH₂CH₂O-, -CH₂CH=CH-,
 -CH=CHCH₂-, -OCH=CH-, -CH=CHO-, -SCH=CH-, -CH=CHS-,
 -N(R')CH=CH-, -CH=CHN(R')-, -OCH=N-, -N=CHO-, -SCH=N-,
 -N=CHS-, -N(R')CH=N-, -N=CHN(R')-, -N(R')N=CH-, -CH=N(R')N-,
 -CH=CHCH=CH-, -OCH₂CH=CH-, -CH=CHCH₂O-, -N=CHCH=CH-,
 15 -CH=CHCH=N-, -N=CHCH=N-, -N=CHN=CH-, or -CH=NCH=N- wherein a
 hydrogen atom bonded to a carbon atom of these groups may be
 substituted with Y, and R' represents a hydrogen atom, a
 C₁-C₁₀ alkyl group, a C₁-C₁₀ haloalkyl group, a C₁-C₁₀
 cyanoalkyl group, a phenyl group which may be substituted
 20 with Z, a pyridyl group which may be substituted with Z, a
 biphenyl group which may be substituted with Z, a naphthyl
 group which may be substituted with Z, a thienyl group which
 may be substituted with Z, a pyrrolyl group which may be
 substituted with Z, a furyl group which may be substituted
 25 with Z, or a condensed heteroaryl group which may be
 substituted with Z; and R³, R⁴, X¹, Y, Z and n, respectively,
 have the same meanings defined hereinbefore.

[16] An electrode for an energy storage device including a polyaminoquinoxaline compound of the following formula (1c) as an electrode active material

[Chemical Formula 16]

5

wherein R^{3'} and R^{4'} join together to form -CH₂CH₂CH₂-, -CH₂CH₂O-,
 -OCH₂CH₂-, -CH₂OCH₂-, -OCH₂O-, -CH₂CH₂S-, -SCH₂CH₂-, -CH₂SCH₂-,
 -CH₂CH₂N(R')-, -N(R')CH₂CH₂-, -CH₂N(R')CH₂-, -CH₂CH₂CH₂CH₂-,
 -CH₂CH₂CH₂O-, -OCH₂CH₂CH₂-, -CH₂CH₂OCH₂-, -CH₂OCH₂CH₂-, -CH₂OCH₂O-,
 10 -OCH₂CH₂O-, -SCH₂CH₂S-, -OCH₂CH₂S-, -SCH₂CH₂O-, -CH₂CH=CH-,
 -CH=CHCH₂-, -OCH=CH-, -CH=CHO-, -SCH=CH-, -CH=CHS-,
 -N(R')CH=CH-, -CH=CHN(R')-, -OCH=N-, -N=CHO-, -SCH=N-,
 -N=CHS-, -N(R')CH=N-, -N=CHN(R')-, -N(R')N=CH-, -CH=N(R')N-,
 -CH=CHCH=CH-, -OCH₂CH=CH-, -CH=CHCH₂O-, -N=CHCH=CH-,
 15 -CH=CHCH=N-, -N=CHCH=N-, -N=CHN=CH-, or -CH=NCH=N- wherein a
 hydrogen atom bonded to a carbon atom of these groups may be
 substituted with Y; and R¹, R², R', X¹, Y, Z and n,
 respectively, have the same meanings as defined hereinbefore.

[17] An electrode for an energy storage device including a
 20 polyaminoquinoxaline compound of the following formula (1d)
 as an electrode active material

[Chemical Formula 17]

wherein R^{1'}, R^{2'}, R^{3'}, R^{4'}, X¹ and n, respectively, have the
 25 same meanings as defined hereinbefore.

[18] The electrode as recited in 15 or 17 above, wherein the group formed by joining R^{1'} and R^{2'} together is of the formula (15)

[Chemical Formula 18]

5

wherein A³ represents O or S, and R⁶³-R⁶⁶ independently represent a hydrogen atom, a halogen atom, a cyano group, a nitro group, an amino group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a C₁-C₁₀ alkoxy group, a phenyl group which may be substituted with Z, a naphthyl group which may be substituted with Z or a thienyl group which may be substituted with Z, in which Z has the same meaning as defined hereinbefore.

10

[19] The electrode as recited in 16 or 17 above, wherein the group formed by joining R^{3'} and R^{4'} together is of the formula (16)

15

[Chemical Formula 19]

wherein A⁴ represents O or S, and R⁶⁷-R⁷⁰ independently represent a hydrogen atom, a halogen atom, a cyano group, a nitro group, an amino group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a C₁-C₁₀ alkoxy group, a phenyl group which may be substituted with Z, a naphthyl group which may be substituted with Z or a thienyl group which may be substituted with Z, in which Z represents a halogen atom, a cyano group, a nitro group, an amino group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a C₁-C₁₀ haloalkyl group, a C₁-C₁₀ alkoxy group, a C₁-C₁₀ cyanoalkyl group, a phenyl group, a biphenyl group, a naphthyl group, a thienyl group, a pyrrolyl group, a furyl group or a condensed heteroaryl group.

20

25

30

[20] The electrode as recited in 16 or 17 above, wherein the group formed by joining R^{3'} and R^{4'} is of the formula (17)

[Chemical Formula 20]

5 wherein R⁷¹ and R⁷² independently represent a hydrogen atom, a halogen atom, a cyano group, a nitro group, an amino group, an epoxy group, a vinyl group, a C₁-C₁₀ alkyl group, a C₁-C₁₀ alkoxy group, a phenyl group which may be substituted with Z, a naphthyl group which may be substituted with Z or a thienyl
10 group which may be substituted with Z, in which Z has the same meaning as defined hereinbefore.

[21] An energy storage device comprising an electrode for an energy storage device as recited in any one of 1 to 20 above.

[22] A method for making an electrode for an energy storage
15 device as recited in 1, which method comprising applying and building up, on a current collector electrode, an electrode active material made of a polyaminoquinoxaline compound represented by the afore-indicated formula (1a).

[23] A method for making an electrode for an energy storage
20 device as recited in 15 above, which method comprising applying and building up, on a current collector electrode, an electrode active material made of a polyaminoquinoxaline compound represented by the afore-indicated formula (1b).

[24] A method for making an electrode for an energy storage
25 device as recited in 16 above, which method comprising applying and building up, on a current collector electrode, an electrode active material made of a polyaminoquinoxaline compound represented by the afore-indicated formula (1c).

[25] A method for making an electrode for an energy storage
30 device as recited in 17 above, which method comprising applying and building up, on a current collector electrode, an electrode active material made of a polyaminoquinoxaline compound represented by the afore-indicated formula (1d).

[26] A method for making an electrode for an energy storage device as recited in 1 above, which method comprising forming an aminoquinoxaline compound represented by the formula (18a) by electrolytic polymerization on a current collector electrode

[Chemical Formula 21]

wherein X^2 represents $-NH-R^{73}-NH_2$ or $-NH-R^{74}$, in which R^{73} represents a C_1-C_{10} alkylene group, a $-C(O)CH_2-$, $-CH_2C(O)-$, a
10 divalent benzene ring which may be substituted with Y, a divalent pyridine ring which may be substituted with Y, a divalent biphenyl group which may be substituted with Y, a divalent naphthalene ring which may be substituted with Y, a divalent thiophene ring which may be substituted with Y, a
15 divalent pyrrole ring which may be substituted with Y, a furan ring which may be substituted with Y, or a condensed hetero ring which may be substituted with Y, and R^{74} a C_1-C_{10} alkyl group, an acetyl group, a phenyl group which may be substituted with Y, a pyridyl group which may be substituted
20 with Y, a biphenyl group which may be substituted with Y, a naphthyl group which may be substituted with Y, a thienyl group which may be substituted with Y, a pyrrolyl group which may be substituted with Y, a furyl group which may be substituted with Y, or a condensed heteroaryl group which may
25 be substituted with Y; and
 R^1 , R^2 , R^3 , R^4 and Y, respectively, have the same meanings as defined hereinbefore.

[27] A method for making an electrode for an energy storage device as recited in 15 above, which method comprising electrolytically polymerizing an aminoquinoxaline compound represented by the formula (18b) on a current collector electrode,

[Chemical Formula 22]

wherein R^{1'}, R^{2'}, R³, R⁴ and X², respectively, have the same meanings as defined hereinbefore.

[28] A method for making an electrode for an energy storage device as recited in 16 above, which method comprising electrolytically polymerizing an aminoquinoxaline compound represented by the formula (18c) on a current collector electrode,

[Chemical Formula 23]

wherein R¹, R², R^{3'}, R^{4'} and X², respectively, have the same meanings as defined hereinbefore.

[29] A method for making an electrode for an energy storage device as recited in 17 above, which method comprising electrolytically polymerizing an aminoquinoxaline compound represented by the formula (18d) on a current collector electrode,

wherein R^{1'}, R^{2'}, R^{3'}, R^{4'} and X², respectively, have the same meanings as defined hereinbefore.

5

ADVANTAGEOUS EFFECTS OF THE INVENTION

[0012]

The polyaminoquinoxaline compounds of the formulae (1a) to (1d) used as an electrode active material of an electrode for an energy storage device according to the invention have a good heat resistance and is readily controllable with respect to the electrochemical redox potential thereof involving proton movement, and have good cyclic properties.

Moreover, these polyaminoquinoxaline compounds have an electron donative group and an electron acceptive group in one molecule, and are those conductive polymer compounds which not only can be used as either of a positive electrode or a negative electrode, but also exhibit a wide potential activity.

The device that is arranged as having an electrode for an energy storage device of the invention using a polyaminoquinoxaline compound as an electrode active material ensures storage at high capacitance.

Especially, when the polyaminoquinoxaline compound is used as an electrode for an electric double layer capacitor, the redox reaction of the electrode active material and the electric double layer occurring on the surface of the electrode both function as an energy source, so that storage of a higher capacitance is enabled than in a conventional electric double layer capacitor using active carbon alone.

BEST MODE FOR CARRYING OUT THE INVENTION

[0013]

The invention is described in more detail below.

The electrode of an energy storage device according to the invention is comprising, as an electrode active material, a polyaminoquinoxaline compound represented by any one of the afore-indicated formulae (1a)-(1d).

Initially, the polyaminoquinoxaline compounds of the formulae (1a)-(1d) or the aminoquinoxaline compounds of the formulae (18a)-(18d) are described.

In these formulae, R^1 and R^2 independently represent a hydrogen atom, a hydroxyl group, a C_1 - C_{10} alkyl group, a C_1 - C_{10} alkoxy group, a phenyl group which may be substituted with Y, a pyridyl group which may be substituted with Y, a biphenyl group which may be substituted with Y, a naphthyl group which may be substituted with Y, a thienyl group which may be substituted with Y, a pyrrolyl group which may be substituted with Y, a furyl group which may be substituted with Y or a condensed heteroaryl group which may be substituted with Y provided that when R^1 and R^2 are, respectively, the above-defined phenyl, pyridyl, biphenyl, naphthyl, thienyl, pyrrolyl, furyl or condensed heteroaryl group, these groups may be joined through a single bond.

[0014]

$R^{1'}$ and $R^{2'}$ join together to form $-CH_2CH_2CH_2-$, $-CH_2CH_2O-$, $-OCH_2CH_2-$, $-CH_2OCH_2-$, $-OCH_2O-$, $-CH_2CH_2S-$, $-SCH_2CH_2-$, $-CH_2SCH_2-$, $-CH_2CH_2N(R')$, $-N(R')CH_2CH_2-$, $-CH_2N(R')CH_2-$, $-CH_2CH_2CH_2CH_2-$, $-CH_2CH_2CH_2O-$, $-OCH_2CH_2CH_2-$, $-CH_2CH_2OCH_2-$, $-CH_2OCH_2CH_2-$, $-CH_2OCH_2O-$, $-OCH_2CH_2O-$, $-SCH_2CH_2S-$, $-OCH_2CH_2S-$, $-SCH_2CH_2O-$, $-CH_2CH=CH-$, $-CH=CHCH_2-$, $-OCH=CH-$, $-CH=CHO-$, $-SCH=CH-$, $-CH=CHS-$, $-N(R')CH=CH-$, $-CH=CHN(R')$, $-OCH=N-$, $-N=CHO-$, $-SCH=N-$, $-N=CHS-$, $-N(R')CH=N-$, $-N=CHN(R')$, $-N(R')N=CH-$, $-CH=N(R')N-$, $-CH=CHCH=CH-$, $-OCH_2CH=CH-$, $-CH=CHCH_2O-$, $-N=CHCH=CH-$, $-CH=CHCH=N-$, $-N=CHCH=N-$, $-N=CHN=CH-$, or $-CH=NCH=N-$ wherein a hydrogen atom bonded to a carbon atom of these groups may be substituted with Y, and R' represents a hydrogen atom, a C_1 - C_{10} alkyl group, a C_1 - C_{10} haloalkyl group, a C_1 - C_{10}

cyanoalkyl group, a phenyl group which may be substituted with Z, a pyridyl group which may be substituted with Z, a biphenyl group which may be substituted with Z, a naphthyl group which may be substituted with Z, a thienyl group which may be substituted with Z, a pyrrolyl group which may be substituted with Z, a furyl group which may be substituted with Z, or a condensed heteroaryl group which may be substituted with Z.

More particularly, mention is made of those groups of the following formulae (2) to (5), (14) and (15):

[0015]

[Chemical Formula 25]

(2)

(3)

(4)

(5)

(14)

(15)

[0016]

When the solubility of the aminoquinoxaline compound is taken into account, R¹, R², R^{1'} and R^{2'} should preferably be substituted with substituent Y. The substituent Y should preferably be a C₁-C₁₀ alkyl group or a C₁-C₁₀ alkoxy group, more preferably a C₁-C₅ alkyl group or a C₁-C₅ alkoxy group.

When the electric property of the aminoquinoxaline compound is taken into account, R¹ and R² should preferably be the group represented by the above formula (14) formed by

bonding R^1 and R^2 through a single bond. Especially, A^2 , in the formula (14), should preferably be carbon atom.

On the other hand, R^3 and R^4 independently represent a hydrogen atom, a halogen atom, a cyano group, a nitro group, an amino group, a C_1 - C_{10} alkyl group, a C_1 - C_{10} alkoxy group, a phenyl group which may be substituted with Y, a pyridyl group which may be substituted with Y, a biphenyl group which may be substituted with Y, a naphthyl group which may be substituted with Y, a thienyl group which may be substituted with Y, a pyrrolyl group which may be substituted with Y, a furyl group which may be substituted with Y or a condensed heteroaryl group which may be substituted with Y provided that when R^3 and R^4 are, respectively, the above-defined phenyl, pyridyl, biphenyl, naphthyl, thienyl, pyrrolyl, furyl or condensed heteroaryl group, these groups may be joined through a single bond.

[0017]

$R^{3'}$ and $R^{4'}$ join together to form $-CH_2CH_2CH_2-$, $-CH_2CH_2O-$, $-OCH_2CH_2-$, $-CH_2OCH_2-$, $-OCH_2O-$, $-CH_2CH_2S-$, $-SCH_2CH_2-$, $-CH_2SCH_2-$, $-CH_2CH_2N(R')$, $-N(R')CH_2CH_2-$, $-CH_2N(R')CH_2-$, $-CH_2CH_2CH_2CH_2-$, $-CH_2CH_2CH_2O-$, $-OCH_2CH_2CH_2-$, $-CH_2CH_2OCH_2-$, $-CH_2OCH_2CH_2-$, $-CH_2OCH_2O-$, $-OCH_2CH_2O-$, $-SCH_2CH_2S-$, $-OCH_2CH_2S-$, $-SCH_2CH_2O-$, $-CH_2CH=CH-$, $-CH=CHCH_2-$, $-OCH=CH-$, $-CH=CHO-$, $-SCH=CH-$, $-CH=CHS-$, $-N(R')CH=CH-$, $-CH=CHN(R')$, $-OCH=N-$, $-N=CHO-$, $-SCH=N-$, $-N=CHS-$, $-N(R')CH=N-$, $-N=CHN(R')$, $-N(R')N=CH-$, $-CH=N(R')N-$, $-CH=CHCH=CH-$, $-OCH_2CH=CH-$, $-CH=CHCH_2O-$, $-N=CHCH=CH-$, $-CH=CHCH=N-$, $-N=CHCH=N-$, $-N=CHN=CH-$, or $-CH=NCH=N-$ wherein a hydrogen atom bonded to a carbon atom of these groups may be substituted with Y, and Z has the same meaning as defined above.

[0018]

When R^3 and R^4 are, respectively, an alkyl group or an alkoxy group, these groups should preferably have 1 to 5 carbon atoms from the standpoint of conductivity. In view of providing good redox potential, R^3 and R^4 should preferably be a phenyl group, a naphthyl group or a thienyl group. From the standpoint of electric characteristics, R^3 , R^4 , $R^{3'}$ and $R^{4'}$

should preferably be substituted with substituent Y. Such a substituent Y preferably includes, a C₁-C₁₀ alkyl group or a C₁-C₁₀ alkoxy group, more preferably a C₁-C₅ alkyl group or a C₁-C₅ alkoxy group. Specific examples include, aside from those groups of the formulae (2) to (5) and (14) exemplified with respect to the R¹, R², R^{1'} and R^{2'} the groups of the following formulae (16) and (17).

[0019]

[Chemical Formula 26]

(16)

(17)

10

[0020]

In the formulae (1a)-(1d), X¹ represents -NH-R⁵-NH- or -NH-R⁶- wherein R⁵ and R⁶ independently represent a C₁-C₁₀ alkylene group, -C(O)CH₂-, -CH₂C(O)-, a divalent benzene ring which may be substituted with Y, a divalent pyridine ring which may be substituted with Y, a divalent biphenyl group which may be substituted with Y, a divalent naphthalene ring which may be substituted with Y, a divalent thiophene ring which may be substituted with Y, a pyrrole ring which may be substituted with Y, a furan ring which may be substituted with Y, or a condensed hetero ring which may be substituted with Y. Specific examples are those groups of the following formulae (6) to (13):

20

[0021]

[Chemical Formula 27]

[0022]

5 In the afore-indicated formulae (18a)-(18d), X^2 represents $-NH-R^{73}-NH_2$ or $-NH-R^{74}$ wherein R^{73} a C_1-C_{10} alkylene group, $-C(O)-CH_2-$, $-CH_2C(O)-$, a divalent benzene ring which may be substituted with Y, a divalent pyridine ring which may be substituted with Y, a divalent biphenyl group which may be substituted with Y, a divalent naphthalene ring which may be substituted with Y, a divalent thiophene ring which may be substituted with Y, a pyrrole ring which may be substituted with Y, a furan ring which may be substituted with Y, or a condensed hetero ring which may be substituted with Y, and

10 R^{74} represents a C_1-C_{10} alkyl group, an acetyl group, a phenyl group which may be substituted with Y, a pyridyl group which may be substituted with Y, a biphenyl group which may be substituted with Y, a naphthyl which may be substituted with Y, a thienyl group which may be substituted with Y, a

20 pyrrolyl group which may be substituted with Y, a furyl group which may be substituted with Y, or a condensed heteroaryl which may be substituted with Y.

[0023]

From the standpoint of providing good redox potential, R^5 , R^{73} and R^{74} should preferably be a divalent benzene ring, a divalent naphthalene ring or a divalent thiophene ring, respectively. In view of keeping stable electric characteristics such as of a film of a polyaminoquinoxaline compound, these cyclic substituents should preferably be substituted further with substituent Y, respectively.

From the standpoint of providing good redox potential, R^6 should preferably be a phenyl group, a naphthyl group or thienyl group.

In view of keeping stable amorphousness such as of a film made of a polyaminoquinoxaline compound, R^5 , R^6 , R^{73} and R^{74} should preferably be substituted further with substituent Y, respectively. In this case, the substituent Y should preferably include a C_1 - C_{10} alkyl group or a C_1 - C_{10} alkoxy group, more preferably a C_1 - C_5 alkyl group or a C_1 - C_5 alkoxy group.

[0024]

Although the molecular weight of the polyaminoquinoxaline compound represented by the formula (1) is not critical, the weight average molecular weight preferably ranges 1,000 to 100,000, more preferably 4,000 to 50,000. In view of this, although n in the formula (1) is a positive integer of 2 or more, n is preferably an integer sufficient to ensure the above-defined range of the weight average molecular weight, e.g., $n = 2$ to 400.

[0025]

In the above-indicated, respective formulae, the C_1 - C_{10} alkyl group may be linear, branched or cyclic and includes, for example, methyl, ethyl, n-propyl, i-propyl, n-butyl, i-butyl, t-butyl, s-butyl, n-pentyl, n-hexyl, 2-ethylpropyl, 2,2-dimethylpropyl, 1,2-dimethylpropyl, 1,1,2-trimethylpropyl, 1,2,2-trimethylpropyl, 1-ethyl-1-methylpropyl, 1-ethyl-2-methylpropyl, 1-methylbutyl, 2-methylbutyl, 3-methylbutyl, 1,1-dimethylbutyl, 1,2-dimethylbutyl, 1,3-dimethylbutyl, 2,2-dimethylbutyl, 2,3-dimethylbutyl,

3,3-dimethylbutyl, 1-ethylbutyl, 2-ethylbutyl, 1-methylpentyl, 2-methylpentyl, 3-methylpentyl, 4-methylpentyl and the like.

It will be noted that for the C₁-C₁₀ alkylene groups, mention is made of those groups wherein one hydrogen atom is

5 eliminated from the above-indicated alkyl groups.

[0026]

For the C₁-C₁₀ haloalkyl groups, those groups wherein at least one hydrogen atom of the above-indicated alkyl groups is substituted with a halogen atom are mentioned. It should
10 be noted that the halogen atom may be any of chlorine, bromine, iodine and fluorine atoms.

For the C₁-C₁₀ cyanoalkyl groups, those groups wherein at least one hydrogen atom of the above-indicated alkyl groups is substituted with a cyano group are mentioned.

15 For the condensed heteroaryl group, mention is made of thieno[3,4-b]pyrazin-5-yl, furo[3,4-b]pyrazin-5-yl, 6H-pyrolo[3,4-b]pyrazin-5-yl, and the like.

[0027]

The C₁-C₁₀ alkoxy groups may be linear, branched or
20 cyclic and include, for example, methoxy, ethoxy, n-propoxy, i-propoxy, n-butoxy, i-butoxy, s-butoxy, t-butoxy, n-pentyloxy, n-hexyloxy, 1,1-dimethylpropoxy, 1,2-dimethylpropoxy, 2,2-dimethylpropoxy, 1-ethylpropoxy, 1,1,2-trimethylpropoxy, 1,2,2-trimethylpropoxy,
25 1-ethyl-1-methylpropoxy, 1-ethyl-2-methylpropoxy, 1-methylbutoxy, 2-methylbutoxy, 3-methylbutoxy, 1-ethylbutoxy, 2-ethylbutoxy, 1,1-dimethylbutoxy, 1,2-dimethylbutoxy, 1,3-dimethylbutoxy, 2,2-dimethylbutoxy, 2,3-dimethylbutoxy, 3,3-dimethylbutoxy, 1-methylpentyloxy, 2-methylpentyloxy,
30 3-methylpentyloxy, 4-methylpentyloxy and the like.

In the above-indicated groups, "n", "i", "s", and "t", respectively, mean normal, iso, secondary and tertiary.

[0028]

35 Examples of the compounds indicated by the formula (1a) to (1d) include those indicated below although not limitative.

[0029]

[Chemical Formula 28]

5 [0030]

[Chemical Formula 29]

[0031]

[Chemical Formula 30]

[0032]

5 [Chemical Formula 31]

[0033]

[Chemical Formula 32]

[0034]

[Chemical Formula 33]

[0035]

5 Next, the process of synthesizing, for example, a compound represented the formula (18a) (formula (1a)) selected among those compounds of the formulae (18a)-(18d) (formulae (1a)-(1d)) is described. This compound can be prepared from a starting 5-aminoquinoxaline compound
10 represented by the following formula (19)

[0036]

[Chemical Formula 34]

15 wherein R^1 - R^4 , respectively, have the same meanings as defined in the formula (1a).

[0037]

 Although limitation is not placed on a specific manner of synthesis, there may be used processes set forth in
20 Journal of the Chemical Society Perkin Transactions I (J.

Chem. Soc. Perkin Trans. I) 1988, pp. 1331 to 1335, and also in Chemistry Letters (Chem. Lett.) 1997, pp. 1185 to 1186.

For example, a corresponding 5-aminoquinoxaline compound is dissolved in an appropriate solvent and is
5 reacted with nitrofluorobenzene in the presence of an appropriate base at room temperature, followed by hydrogenation reaction in the presence of Pd/C to obtain an intended product wherein a phenyl ring has been introduced at the position of R⁵. An intended compound having a thienyl
10 group at R⁶ can be prepared by dissolving a 5-aminoquinoxaline compound in an appropriate solvent, adding catalytic amounts of Pd₂(dba)₃ and BINAP and reacting with 2-bromothiophene in the presence of an appropriate base.
[0038]

15 It will be noted that the synthesis of the 5-aminoquinoxaline compound of the above formula (19) is not limitative, there can be used a method set out, for example, in Journal of American Chemical Society (J. Am. Chem. Soc.), 1957, Vol. 79, pp. 2245 to 2248, and Journal of Organic
20 Chemistry (J. Org. Chem.), 1966, Vol. 31, pp. 3384 to 3390.
[0039]

Although a process for preparing a polyaminoquinoxaline compound represented by the formula (1a) is not limitative, this polymer compound can be prepared by
25 polymerizing an aminoquinoxaline compound of the formula (18a) by any arbitrary procedure. Such polymerizing procedures may include, for example, chemical oxidation polymerization, electrolytic oxidation polymerization, catalytic polymerization and the like. In most cases, in
30 view of the fact that a polymer can be formed on an electrode surface, chemical oxidation polymerization and electrolytic oxidation polymerization are preferred, of which the electrolytic oxidation polymerization is more preferred.

The oxidizing agent used for the chemical oxidation
35 polymerization is not critical and includes, for example, ammonium persulfate, tetraammonium peroxide, iron chloride, cerium sulfate and the like.

[0040]

A specific procedure for the electrolytic oxidation polymerization is as follows: an oxidizing agent is added, for example, to a monomer of the formula (18a) and well
5 agitated, to which an organic solvent is added thereto so as to make a uniform solution; and the resulting solution is subjected to electrolytic polymerization by use of a three-electrode beaker-shaped cell equipped with a platinum mesh counter electrode and the like.

10 The electrolytic polymerization is carried out, for example, according to an electrochemical measuring system using, as a test electrode substrate, a platinum plate whose surface is abraded with an emery paper and, as a reference electrode, Ag/Ag⁺. For a more specific procedure of
15 electrolytic polymerization, a potential scanning process and a constant potential process may be used, for example. In this way, an intended polymer compound is obtained as deposited on the electrode in the form of a film.

[0041]

20 The oxidizing agents used for the electrolytic oxidation polymerization include, for example, hydrochloric acid, sulfuric acid, perchloric acid, trifluoromethanesulfonic acid, para-toluenesulfonic acid and the like, of which perchloric acid is preferred.

25 Examples of the organic solvents include N,N-dimethylformamide, tetrahydrofuran, acetonitrile, dichloromethane, dimethylsulfoxide, methanol, ethanol and the like, of which N,N-dimethylformamide is preferred.

[0042]

30 While making use of their good characteristics, the polyaminoquinoxaline compounds represented by the formulae (1a)-(1d) illustrated hereinbefore are conveniently applicable to as an active material of an energy storage device, particularly, as an electrode active material. In
35 this connection, the polyaminoquinoxaline per se is conductive in nature and an effect of lowering a contact resistance at an electrode interface can be expected.

The procedure of making an electrode for an energy storage device using the polyaminoquinoxaline compounds represented by the formulae (1a)-(1d) is not critical. The monomer of any one of the foregoing formulae (18a)-(18d) is subjected to electrolytic oxidation polymerization on an electrode to deposit a film of a polymer compound of any one of the formulae (1a)-(1d), thereby making the electrode.

Further, the polyaminoquinoxaline compound can be readily converted to a film according to a vacuum deposition method, a spin coating method, a dipping method, a casting method, a screen printing method or the like. Using these methods, an electrode can be made by coverage with a polyaminoquinoxaline compound-containing film.

[0043]

Especially, an electrode containing a polyaminoquinoxaline compound as an electrode active material can be readily made by use of a method wherein a coating composition containing an electrode active material made of a polyaminoquinoxaline compound represented by any one of the formulae (1a) to (1d), and coating and built up on a current collector electrode.

The components of the coating composition containing a polyaminoquinoxaline compound are not limitative. For instance, a composition comprising a polyaminoquinoxaline compound, a polymer material for improving film-forming properties, a dispersant and the like. The content of the polyaminoquinoxaline compound is, for example, in the range of about 50 to about 90 wt%.

It will be noted that, if necessary, additives such as thermal stabilizers, light stabilizers, fillers, reinforcing agents and the like may be appropriately formulates.

[0044]

With the electrode for an energy storage device stated hereinbefore, only an embodiment where an electrode active material made of a polyaminoquinoxaline compound is deposited on an electrode surface such as by electrolytic polymerization or coating has been set forth, to which the

invention is not limited. For instance, an electrode composition made by mixing with an electrode active material of a polyaminoquinoxaline compound beforehand is used to make an electrode.

5 [0045]

The electrode for energy storage devices can be favorably used in various types of energy storage devices such as electric double layer capacitors, lithium ion cells, proton polymer cells, nickel hydrogen cells, lead batteries and the like. It is preferred to use the electrode for electric double layer capacitors, lithium ion cells, and proton polymer cells.

Especially, when the electrode is used for an electric double layer capacitor, both the redox reaction of the electrode active material and the electric double layer occurring on the electrode surfaces can be used as an energy source, so that storage at a higher capacitance is enabled than with the case of a conventional electric double layer capacitor using active carbon.

20

EXAMPLES

[0046]

The invention is more particularly described by way of Synthetic Examples and Examples, which should not be construed as limiting the invention thereto. Comparative Examples are also described.

[0047]

Synthetic Example 1

Synthesis of 2,3-dihydroxy-5-aminoquinoxaline

30 Prepared according to the following procedures (1) to (3).

(1) Synthesis of 2,3-diaminonitrobenzene

[Chemical Formula 35]

[0048]

14 g of commercially available
1-amino-2,5-dinitrobenzene was dissolved in 225 ml of
methanol, to which a solution of 60 g of sodium sulfide and
5 21 g of sodium hydrogen carbonate dissolved in 240 g of water
was added by use of a dropping funnel while keeping the
reaction temperature at 60°C. After completion of the
addition, agitation was continued at 60°C for 1 hour. After
completion of the reaction, the mixture was cooled down to
10 room temperature and filtered.

m/z: (FD+) 153 (calculated 153.1396)

¹H-NMR: 7.7228, 7.7203, 7.7206, 7.2433, 6.9245, 6.6209,
6.6063, 6.6038, 6.5886, 5.9210, 3.3978 ppm

Yield: 7.79 g (66.5%)

15 Product aspect: Reddish brown fine crystals

Melting point: 140°C

[0049]

(2) Synthesis of 2,3-dihydroxy-5-nitroquinoxaline

[Chemical Formula 36]

[0050]

4 g (26.12 mmol) of 2,3-diaminonitrobenzene and 6.59 g
(52.24 mmol) of commercially available oxalic dehydrate were
dissolved in 50% acetic acid, followed by reaction at a
25 boiling point thereof for 3 hours in a stream of argon.
After completion of the reaction, the mixture was cooled down
to room temperature and the resulting precipitated crystals
were filtered.

Yield: 3.01 g (55.6%)

30 Product aspect: Yellow fine crystals

m/z: 207 (calculated 207.144)

[0051]

(3) Synthesis of 2,3-dihydroxy-5-aminoquinoxaline

[Chemical Formula 37]

5 [0052]

2.00 g of 2,3-dihydroxy-5-nitroquinoxaline was dissolved in 100 g of a 1:1 methanol and dioxane solvent, after which the reaction system was well purged with argon, followed by further addition of 1.00 g of 5% Pd/C (hydrous).
10 Thereafter, the system was purged with hydrogen, followed by reaction at room temperature for 20 hours. After completion of the reaction, the reaction product was dispersed in a solution of 6.00 g of potassium carbonate in 130 ml of water and then dissolved therein. 35% hydrochloric acid was
15 gradually added to the solution obtained after filtration thereby obtaining a precipitate.

Yield: 1.10 g

Product aspect: Light yellow fine crystals

m/z: (FD+) 177 (calculated 177. 1616)

20 ¹³C-NMR: 155.8030, 155.6504, 135.9570, 126.8390,
124.1303, 112.3265, 109.6025, 103.8418 ppm

[0053]

Synthetic Example 2

Synthesis of 2,3-diphenyl-5-aminoquinoxaline

25 Prepared according to the following procedures (1) and (2).

(1) Synthesis of 2,3-diphenyl-5-aminoquinoxaline

[0054]

[Chemical Formula 38]

[0055]

1.53 g (10 mmol) of 2,3-diaminonitrobenzene and 2.00 g (9.6 mmol) of benzil were placed in four-necked flask, to which 30 g of a solvent of acetic acid and methanol at a mixing ratio of 1:1 was added for dissolution. Subsequently, the mixture was reacted at a reaction temperature of 70°C for 2 hours. After the reaction, the solvent was removed and the resulting product was extracted with a silica gel column (ethyl acetate: hexane = 1:1).

Yield: 2.11 g

Product aspect: Yellow fine crystals

m/z: 327 (calculated 327.24)

[0056]

(2) Synthesis of 2,3-diphenyl-5-aminoquinoxaline

[Chemical Formula 39]

[0057]

1.04 g of 2,3-diphenyl-5-nitroquinoxaline was dissolved in 30 g of dioxane, followed by purging with argon and further addition of 0.5 g of 5% Pd/C (hydrous). After sufficient purging with argon again, hydrogen was added and reacted at room temperature for 30 hours. After completion of the reaction, the reaction mixture was filtered and the solvent was removed, followed by isolation and purification with a silica gel column (ethyl acetate: hexane = 1:3).

Yield: 0.73 g

Product aspect: Yellow fine crystals

m/z: 297 (calculated M: 297.36)

¹³C-NMR: 153.6055, 150.1185, 144.2280, 141.9619,
139.4516, 139.3524, 131.1348, 130.0894,
129.9368, 128.7694, 128.6473, 128.3497,
128.1743, 117.2098, 110.2511 ppm

[0058]

Synthetic Example 3

Synthesis of 2,3-di(4-methylphenyl)-5-aminoquinoxaline

Prepared according to the following procedures (1) and (2).

- 5 (1) Synthesis of 2,3-di(4-methylphenyl)-5-nitroquinoxaline
[Chemical Formula 40]

[0059]

1.84 g (12 mmol) of 2,3-diaminonitrobenzene and 2.38 g
10 (10 mmol) of 4,4'-dimethylbenzil were dissolved in 40 g of a
mixed solvent of acetic acid and methanol (1:1) and reacted
at a reaction temperature of 80°C for 4 hours. After
completion of the reaction, the solvent was removed and the
resulting reaction product was extracted by means of a silica
15 gel column.

Yield: 1.30 g

Product aspect: Yellow fine crystals

m/z: 355 (calculated 355.39)

¹³C-NMR: 154.8950, 154.8339, 147.0894, 140.7563,

- 25 (2) Synthesis of 2,3-di(4-methylphenyl)-5-aminoquinoxaline
[Chemical Formula 41]

[0061]

2.02 g of 2,3-di(4-methylphenyl)-5-nitroquinoxaline was dissolved in 30 g of dioxane, followed by purging with argon and adding 0.6 g of 5% Pd/C (hydrous). After purging with argon again, the system was purged with hydrogen for reaction at room temperature for 18 hours. After completion of the reaction, the system was filtered. The filtration residue was washed with acetone and then with dioxane and filtered again. The solvent was removed from the resulting filtrate, followed by extracting a reaction product by use of a silica gel column.

Yield: 1.36 g

Product aspect: Yellow fine crystals

m/z: 325 (calculated 325.14)

Synthetic Example 4

Synthesis of 2,3-di(4-methoxyphenyl)-5-aminoquinoxaline

Prepared according to the following procedures (1) and (2).

(1) Synthesis of 2,3-(4-dimethoxyphenyl)-5-nitroquinoxaline

[Chemical Formula 42]

[0063]

1.54 g (10 mmol) of 2,3-diaminonitrobenzene and 2.25 g (8.3 mmol) of 4,4'-dimethoxybenzil were dissolved in 100 g of a mixed solvent (acetic acid : methanol = 1:1) and reacted at room temperature for 20 hours, and, after completion of the reaction, filtered. The resulting filtration residue was washed with acetone and dioxane, and again filtered. The

solvent was removed from the resulting filtrate, and a reaction product was extracted by means of a silica gel column.

Yield: 1.24 g

Product aspect: Yellow fine crystals

m/z: 387 (calculated: 387.39)

Synthetic Example 5

Synthesis of 2,3-di(4-bromophenyl)-5-aminoquinoxaline

Prepared according to the following procedures (1) and (2).

- 5 (1) Synthesis of 2,3-di(4-bromophenyl)-5-nitroquinoxaline
[Chemical Formula 44]

[0067]

1.53 g (10 mmol) of 2,3-diaminonitrobenzene and 3.68 g
10 (10 mmol) of 4,4'-dibromobenzil were dissolved in 80 g of a
mixed solvent of acetic acid and methanol (1:1) and reacted
at a reaction temperature of 70°C for 30 hours. After
completion of the reaction, the solvent was removed and a
reaction product was extracted by means of a silica gel.

15 Yield: 1.89 g

Product aspect: Yellow fine crystals

m/z: 485 (calculated 485.12)

¹³C-NMR: 153.4453, 153.3613, 147.0065, 140.7945,

[0068]

- (2) Synthesis of 2,3-di(4-bromophenyl)-5-aminoquinoxaline
[Chemical Formula 45]

25

[0069]

1.01 g (2.1 mmol) of 2,3-di(4-bromophenyl)-5-nitroquinoxaline was dissolved in 30 g of dioxane, followed by purging well with argon, adding 0.3 g of 5% Pd/C (hydrous) and purging well with argon again. This system was purged with a hydrogen gas and reacted at room temperature for 24 hours. After completion of the reaction, the system was filtered. The resulting filtration residue was washed with acetone and then with dioxane and filtered again. The solvent was removed from the resulting filtrate and a reaction product was extracted with a silica gel column.

Yield: 0.66 g

Product aspect: Yellow fine crystals

m/z: 455 (calculated: 455.12)

¹³C-NMR: 151.966, 148.493, 144.065, 141.897, 137.920, 137.820, 135.042, 131.706, 131.637, 131.492, 131.400, 131.248, 123.514, 123.377, 117.064, 110.452 ppm

[0070]

Synthetic Example 6

Synthesis of 2,3-dithienyl-5-aminoquinoxaline

Prepared according to the following procedures (1) and (2).

(1) Synthesis of 2,3-dithienyl-5-nitroquinoxaline

[Chemical Formula 46]

[0071]

0.022 g (0.144 mmol) of 2,2'-diaminonitrobenzene and 0.01938 g (0.087 mmol) of 2,2'-thienyl were dissolved in 3 g of a mixed solvent of acetic acid and methanol (1:1) and reacted at a reaction temperature of 70°C for 30 hours. After completion of the reaction, the solvent was removed and the resulting reaction product was extracted by means of a silica gel column.

Yield: 0.04 g

Product aspect: Yellow fine crystals

m/z: 339 (calculated: 339.40)

[0072]

- 5 (2) Synthesis of 2,3-dithienyl-5-aminoquinoxaline
[Chemical Formula 47]

[0073]

10 1.01 g (3.0 mmol) of 2,3-dithienyl-5-nitroquinoxaline
was dissolved in 30 g of dioxane and the system was fully
purged with argon. Thereafter, 0.3 g of 5% Pd/C (hydrous)
was added, followed by purging satisfactorily with argon
again. This system was purged with a hydrogen gas and
reacted at room temperature for 24 hours. After completion
15 of the reaction, the system was filtered. The resulting
filtration residue was washed with acetone and then with
dioxane, and was filtered again. The solvent was removed
from the resulting filtrate, and a reaction product was
extracted with a silica gel column.

20 Yield: 0.40 g

Product aspect: Yellowish brown fine crystals

m/z: 309 (calculated 309.42)

25 ¹³C-NMR: 146.569, 143.752, 142.111, 141.546, 141.233,

[0074]

Synthetic Example 7

Synthesis of 10-aminodibenzo(A,C)phenazine

30 Prepared according to the following procedures (1) and (2).

(1) Synthesis of 1,2,3-triaminobenzene

[Chemical Formula 48]

[0075]

5 15.0 g (82 mmol) of 2,6-dinitroaniline was dissolved in 150 g of THF and the reaction system was satisfactorily purged with nitrogen, to which 7.6 g of 5% Pd/C (hydrous) was added. Thereafter, the system was purged with hydrogen, followed by reaction at room temperature for 15 hours. After
10 completion of the reaction, the reaction solution was filtered to remove Pd therefrom, and the resulting filtrate was condensed as it is to obtain the intended product. The thus obtained product was instable and was used as it is in a subsequent reaction.

15 [0076]

(2) Synthesis of 10-aminodibenzo(A,C)phenazine

[Chemical Formula 49]

[0077]

20 10.1 g (82 mmol) of 1,2,3-triaminobenzene and 14.6 g (70 mmol) of 9,10-phenanthrenequinone were placed in a four-necked flask, to which 350 g of a solvent of acetic acid and methanol at 1:1 was added for dissolution, followed by reaction at a reaction temperature of 70°C for 2 hours.
25 After the reaction, the solvent was removed and the resulting product was washed with methanol to obtain the intended product.

Yield: 17.1 g

Product aspect: Ocher solid

m/z: 295 (calculated: 295.11)

¹³C-NMR: 146.932, 144.145, 143.084, 139.740, 133.473,

[0078]

Synthetic Example 8

- 10 Synthesis of 2,3-diphenyl-5-(4-aminophenyl)aminoquinoxaline
Prepared according to the following procedures (1) and (2).
(1) Synthesis of 2,3-diphenyl-5-(4-nitrophenyl)aminoquinoxaline
[Chemical Formula 50]

15 [0079]

- While agitating 4.0 g (13.4 mmol) of 2,3-diphenyl)-5-aminoquinoxaline, 2.1 g (14.9 mmol) of 4-fluoronitrobenzene and 100 ml of dimethylsulfoxide, 5.0 g (44.6 mmol) of t-butoxy potassium was gently added. After completion of the
20 addition, the reaction container was purged with nitrogen, followed by agitation at room temperature for 24 hours. After completion of the reaction, 100 ml of water was added while cooling, and an organic phase was extracted by use of a chloroform solvent, followed by concentration to obtain the
25 intended product.

Yield: 5.4 g

[0080]

(2) Synthesis of 2,3-diphenyl-5-(4-aminophenyl)aminoquinoxaline
[Chemical Formula 51]

5 [0081]

5.4 g (2.9 mmol) of 2,3-diphenyl-5-(4-nitrophenyl)-aminoquinoxaline was dissolved in 100 ml of tetrahydrofuran, and a reaction container was purged with nitrogen. Thereafter, 5.0 g of 5% Pd/C (hydrous) was added, followed by
10 sufficient purging with nitrogen again. This system was purged with hydrogen, followed by reaction at room temperature for 10 hours. After completion of the reaction, the system was filtered, and the resulting filtration residue was washed with tetrahydrofuran and filtered again. The
15 solvent was removed from the resulting filtrate, and a reaction product was recrystallized from a mixed solvent of tetrahydrofuran/heptane.

Yield: 3.9 g

Product aspect: orange solid

20 m/z: 388 (calculated: 388.17)

25 [0082]

Synthetic Example 9

Synthesis of 2,3-di(4-methylphenyl)-5-(4-aminophenyl)-aminoquinoxaline

Prepared according to the following procedures (1) and (2).

(1) Synthesis of 2,3-di(4-methylphenyl)-5-(4-nitrophenyl)-
aminoquinoxaline

[Chemical Formula 52]

5 [0083]

While agitating 3.0 g (9.2 mmol) of 2,3-di(4-methyl-
phenyl)-5-aminoquinoxaline, 1.4 g (9.9 mmol) of
4-fluoronitrobenzene and 100 ml of dimethylsulfoxide, 3.4 g
(30.3 mmol) of t-butoxy potassium was gently added. After
10 completion of the addition, the reaction container was purged
with nitrogen, followed by agitation at room temperature for
20 hours. After completion of the reaction, 100 ml of water
was added while cooling, and an organic phase was extracted
by use of a chloroform solvent, followed by concentration to
15 obtain the intended product.

Yield: 5.9 g

m/z: 446 (calculated: 446.17)

[0084]

(2) Synthesis of 2,3-di(4-methylphenyl)-5-(4-aminophenyl)-
20 aminoquinoxaline

[Chemical Formula 53]

[0085]

5.9 g (13.2 mmol) of 2,3-di(4-methylphenyl)-5-(4-nitrophenyl)aminoquinoxaline was dissolved in 70 ml of tetrahydrofuran, and a reaction container was purged with nitrogen. Thereafter, 2.0 g of 5% Pd/C (hydrous) was added, followed by sufficient purging with nitrogen again. This system was purged with hydrogen, followed by reaction at room temperature for 13 hours. After completion of the reaction, the system was filtered, and the resulting filtration residue was washed with tetrahydrofuran and filtered again. The solvent was removed from the resulting filtrate, and a reaction product was extracted with a silica gel column.

Yield: 1.1 g

Product aspect: orange solid

m/z: 416 (calculated: 416.20)

[0086]

Synthetic Example 10

Synthesis of 2,3-di(4-methoxyphenyl)-5-(4-aminophenyl)-aminoquinoxaline

Prepared according to the following procedures (1) and (2).

(1) Synthesis of 2,3-di(4-methoxyphenyl)-5-(4-aminophenyl)-aminoquinoxaline

[Chemical Formula 54]

[0087]

While agitating 5.0 g (14.0 mmol) of 2,3-di(4-methoxyphenyl)-5-aminoquinoxaline, 2.4 g (17.0 mmol) of 4-fluoronitrobenzene and 120 ml of dimethylsulfoxide, 5.7 g (50.8 mmol) of t-butoxy potassium was gently added. After completion of the addition, the reaction container was purged with nitrogen, followed by agitation at room temperature for 8 hours. After completion of the reaction, 100 ml of water was added while cooling, and an organic phase was extracted by use of a chloroform solvent, followed by concentration to obtain the intended product.

Yield: 8.3 g

Product aspect: brown solid

[0088]

(2) Synthesis of 2,3-di(4-methoxyphenyl)-5-(4-aminophenyl)-aminoquinoxaline

[Chemical Formula 55]

[0089]

8.3 g (17.3 mmol) of 2,3-di(4-methoxyphenyl)-5-(4-nitrophenyl)aminoquinoxaline was dissolved in 100 ml of tetrahydrofuran, and a reaction container was purged with nitrogen. Thereafter, 5.0 g of 5% Pd/C (hydrous) was added, followed by sufficient purging with nitrogen again. This system was purged with hydrogen, followed by reaction at room temperature for 10 hours. After completion of the reaction, the system was filtered, and the resulting filtration residue was washed with tetrahydrofuran and filtered again. The solvent was removed from the resulting filtrate, and a

reaction product was recrystallized in hexane to obtain the intended product.

Yield: 4.5 g

Product aspect: orange solid

5 m/z: 448 (calculated: 448.119)

Synthetic Example 11

Synthesis of 2,3-di(2-thienyl)-5-(4-aminophenyl)amino-
quinoxaline

Prepared according to the following procedures (1) and (2).

15 (1) Synthesis of 2,3-di(2-thienyl)-5-(4-nitrophenyl)amino-
quinoxaline

[Chemical Formula 56]

[0091]

20 While agitating 3.1 g (9.9 mmol) of 2,3-di(2-thienyl)-
5-aminoquinoxaline, 1.4 g (9.9 mmol) of 4-fluoronitrobenzene
and 15 g of dimethylsulfoxide, 3.3 g (29.6 mmol) of t-butoxy
potassium was gently added. After completion of the addition,
the reaction container was purged with nitrogen, followed by
25 agitation at room temperature for 14 hours. After completion
of the reaction, 100 ml of water was added while cooling, and
the resulting compound was filtered and dried, followed by
purification with a silica gel column.

Yield: 2.6 g

30 Product aspect: yellow solid

[0092]

(2) Synthesis of 2,3-di(2-thienyl)-5-(4-aminophenyl)aminoquinoxaline

[Chemical Formula 57]

5

[0093]

2.2 g (5.1 mmol) of 2,3-di(2-thienyl)-5-(4-nitrophenyl)aminoquinoxaline was dissolved in 50 ml of tetrahydrofuran, and a reaction container was purged with nitrogen. Thereafter, 0.7 g of 5% Pd/C (hydrous) was added, followed by sufficient purging with nitrogen again. This system was purged with hydrogen, followed by reaction at room temperature for 5 hours. After completion of the reaction, the system was filtered, and the resulting filtration residue was washed with tetrahydrofuran and filtered again. The solvent was removed from the resulting filtrate, and a reaction product was extracted with a silica gel column.

Yield: 1.9 g
Product aspect: orange solid
m/z: 399 (calculated: 400.08)
¹³C-NMR: 146.665, 143.161, 143.009, 142.619, 142.009, 141.413, 132.084, 131.535, 130.443, 129.061, 128.840, 128.603, 128.473, 127.618, 127.512, 124.878, 116.068, 115.931, 106.930 ppm

Synthetic Example 12

Synthesis of N-4-aminophenyl-10-aminodibenzo(A,C)phenazine

Prepared according to the following procedures (1) and (2).

(1) Synthesis of N-4-nitrophenyl-10-aminodibenzo(A,C)phenazine
[Chemical Formula 58]

[0095]

5 While agitating 10.0 g (34 mmol) of
10-aminodibenzo(A,C)phenazine, 4.8 g (34 mmol) of
4-fluoronitrobenzene and 500 ml of dimethylsulfoxide, 19.4 g
(173 mmol) of t-butoxy potassium was gently added. After
completion of the addition, the reaction container was
10 charged with nitrogen, followed by agitation at room
temperature for 24 hours. After completion of the reaction,
500 ml of water was added while cooling, after which the
reaction solution was filtered to obtain a filtration residue.
The thus obtained residue was washed with methanol to obtain
15 the intended product.

[0096]

(2) Synthesis of N-4-aminophenyl-10-aminodibenzo(A,C)phenazine
[Chemical Formula 59]

[0097]

4.5 g (10.8 mmol) of N-4-nitrophenyl-10-amnodibenzo-(A,C)phenazine was dissolved in 200 ml of tetrahydrofuran, and the reaction container was purged with nitrogen.

5 Thereafter, 4.6 g of 5% Pd/C (hydrous) was added, followed by sufficient purging with nitrogen again. This system was purged with hydrogen, followed by reaction at room temperature for 10 hours. After completion of the reaction, the system was filtered, and the resulting filtration residue
10 was further washed with tetrahydrofuran and purified with a column to obtain the intended product.

20 Example 1

Synthesis of poly{2,3-diphenyl-5-(4-aminophenyl)-aminoquinoxaline}

Using a three-electrode beaker cell equipped with a platinum mesh counter electrode, the intended compound was
25 synthesized by carrying out electrolytic oxidation according to the following potential scanning procedure.

More particularly, there was used a solution of 0.19 mg (0.5 mmol) of 2,3-diphenyl-5-(4-aminophenyl)aminoquinoxaline and 1.05 ml (11 mmol) of perchloric acid
30 dissolved in 6.5 g of N,N-dimethylformamide. Electrolytic polymerization was conducted in such a way that a test electrode substrate used was a platinum sheet (1.0 cm² per surface) abraded with an emery paper on the surface thereof, a reference electrode was Ag/Ag⁺, and an electrochemical
35 measuring system (made by BAS Inc.) was used for carrying out potential scanning under conditions of a potential range of 400 to 700 mV, a scanning speed of 50 mVsec⁻¹ and 30

potential scanning cycles. The intended compound polymerized on the electrode was obtained.

Product aspect: black solid

TOF-MS: m/z 415 (monomer), 772 (dimer), 1156 (trimer).

5 [0099]

Example 2

Synthesis of poly{2,3-di(4-methylphenyl)-5-(4-aminophenyl)-aminoquinoxaline}

10 Using a three-electrode beaker cell equipped with a platinum mesh counter electrode, the intended product was synthesized by carrying out electrolytic oxidation according to the following potential scanning procedure.

15 More particularly, there was used a solution of 0.21 mg (0.5 mmol) of 2,3-di(4-methylphenyl)-5-(4-aminophenyl)-aminoquinoxaline and 1.05 ml (11 mmol) of perchloric acid dissolved in 6.5 g of N,N-dimethylformamide. Electrolytic polymerization was conducted in such a way that a test electrode substrate used was a platinum sheet (1.0 cm² per surface) abraded with an emery paper on the surface thereof, 20 a reference electrode was Ag/Ag⁺, and an electrochemical measuring system (made by BAS Inc.) was used for carrying out potential scanning under conditions of a potential range of 1300 to 1600 mV, a scanning speed of 100 mVsec⁻¹ and 30 potential scanning cycles. The intended polymerized compound 25 polymerized on the electrode was obtained.

Product aspect: Black solid

TOF-MS: m/z 429 (monomer), 826 (dimer), 1240 (trimer), 1667 (tetramer)

[0100]

30 Example 3

Poly{2,3-di(2-thienyl)-5-(4-aminophenyl)aminoquinoxaline}

Using a three-electrode beaker cell equipped with a platinum mesh counter electrode, the intended product was synthesized by carrying out electrolytic oxidation according 35 to the following potential scanning procedure.

More particularly, there was used a solution of 0.20 mg (0.5 mmol) of 2,3-di(4-thienyl)-5-(4-aminophenyl)-

aminoquinoxaline and 1.05 ml (11 mmol) of perchloric acid dissolved in 6.5 g of N,N-dimethylformamide. Electrolytic polymerization was conducted in such a way that a test electrode substrate used was a platinum sheet (1.0 cm² per surface) abraded with an emery paper on the surface thereof, a reference electrode was Ag/Ag⁺, and an electrochemical measuring system (made by BAS Inc.) was used for carrying out potential scanning under conditions of a potential range of 400 to 700 mV, a scanning speed of 100 mVsec⁻¹ and 30 potential scanning cycles. The intended polymerized compound polymerized on the electrode was obtained.

Product aspect: black solid

TOF-MS: m/z 398 (monomer), 793 (dimer), 1192 (trimer), 1602 (tetramer), 1987 (pentamer)

[0101]

Example 4

Synthesis of poly{N-4-aminophenyl-10-aminodibenzo(A,C)-phenazine}

Using a three-electrode beaker cell equipped with a platinum mesh counter electrode, the intended product was synthesized by carrying out electrolytic oxidation according to the following constant potential method.

More particularly, there was used a solution of 0.19 mg (0.5 mmol) of N-4-aminophenyl-10-dibenzo(A,C)phenazine and 1.05 ml (11 mmol) of perchloric acid dissolved in 6.5 g of N,N-dimethylformamide. Electrolytic polymerization was conducted in such a way that a test electrode substrate used was a platinum sheet (1.0 cm² per surface) abraded with an emery paper on the surface thereof, a reference electrode was Ag/Ag⁺, and an electrochemical measuring system (made by BAS Inc.) was used. According to a constant potential method, polymerization was conducted at 0.7 V while regulating an electric quantity at 2.0 C/cm², under which a black polymer film was obtained on the surface of the test electrode. The thus obtained film was washed on the surfaces thereof with N,N-dimethylformamide.

TOF-MS: m/z 781 (dimer), 1167 (trimer), 1552 (tetramer),
1940 (pentamer)

Oxidation and reduction peaks measured by cyclic
voltammetry (measured in an acetonitrile solution of 0.1
5 mol/liter of tetraethylammonium perchlorate): oxidation peak
at 700 mV, 1000 mV and reduction peak at 200 mV, 300 mV.
[0102]

The electrode obtained in Example 4 was used to make a
cell, and a charge and discharge test was carried out
10 according to the following procedure to obtain an
electrostatic capacitance, revealing that it was at 58 F/g.
In more detail, a discharge capacitance of 48.5 F/g at the
first cycle was obtained, and the capacitance was improved to
65.8 F/g at the fifth cycle. At the tenth cycle, the
15 capacitance was kept at 58.5 F/g.
(Charge and discharge testing method)

Using a three electrode beaker cell wherein the
platinum electrode formed with the polymer film thereon was
provided as a test electrode, a platinum sheet provided as a
20 counter electrode and Ag/Ag⁺ provided as a reference
electrode, a constant current charge and discharge test was
effected under the following conditions.

The above cell was set in an acetonitrile solution of
0.1 mol/liter of tetraethylammonium perchlorate and subjected
25 to measurement at a current density of 0.5 mA/cm² and a cut
off potential of 1.5 V to -0.5 V, thereby providing a value
at a tenth cycle as a measurement.

Comparative Example 1

30 Synthesis of poly{10-aminodibenzo(A,C)phenazine}

Using a three-electrode beaker cell equipped with a
platinum mesh counter electrode, the intended product was
synthesized by carrying out electrolytic oxidation according
to the following constant potential method.

35 More particularly, there was used a solution of 0.15
mg (0.5 mmol) of 10-aminodibenzo (A,C)phenazine and 1.05 ml
(11 mmol) of perchloric acid dissolved in 6.5 g of

N,N-dimethylformamide. Electrolytic polymerization was conducted in such a way that a test electrode substrate used was a platinum sheet (1.0 cm^2 per surface) abraded with an emery paper on the surface thereof, a reference electrode was
5 Ag/Ag⁺, and an electrochemical measuring system (made by BAS Inc.) was used. According to the constant potential method, polymerization was conducted at 0.9 V while regulating an electric quantity at 2.0 C/cm^2 , under which a black polymer film was obtained on the surface of the test electrode. The
10 thus obtained film was washed on the surfaces thereof with N,N-dimethylformamide.

[0104]

TOF-MS: m/z 596.9 (dimer), 893.9 (trimer),
1192.3 (tetramer), 1488.5 (pentamer),
15 1788.7 (hexamer), 2088.9 (heptamer)

Oxidation and reduction peaks measured by cyclic voltammetry (measured in an acetonitrile solution of 0.1 mol/liter of tetraethylammonium perchlorate): oxidation peak at 1100 mV and reduction peak at 200 mV.

20 The electrode obtained in the above Comparative example 1 was used to make a cell, and the cell was subjected to a charge and discharge test under the same conditions as in Example 4. As a result, the electrostatic capacitance was found at 47 F/g. In more detail, a discharge capacitance at
25 a first cycle was at 83.5 F/g, was lowered to 62.0 F/g at a fifth cycle and further lowered to 47.0 F/g at a tenth cycle.
